- Prime farmland  
Total acres - 26,000
  - Unique farmland, other than prime  
Total acres - none reported
  - Additional farmland of statewide importance  
Total acres - 12,500
  - Additional farmland of local importance  
Total acres - none reported
  - Other land
  - Water areas
  - Intermittent water
  - Approximate urban and built-up areas
- Areas represented are greater than 2 acres in size

This map gives an overview of important farmland. It was made by overlaying an interpretation from the published soil survey map to a base map showing roads, boundaries, and names. This procedure may result in slight misreporting of lines and features in certain areas because the scales and dates of the two maps used were different. For specific locations of soil map units that may qualify as important farmland use the published soil survey for the county. If the publication does not specify which map units are important farmlands, the state or local office of the Soil Conservation Service for that area can furnish you a list of important farmland map units. A soil survey publication can be obtained from the state or local office of the Soil Conservation Service, the county agent, or the congressman for that district. Many libraries keep published soil surveys on file for reference.
